

## BOOKS PAGE

**Project intro:-**Books page is a static website or a library.where you can see the interesting books and know every detail of that book like the author,what are the interesting elements in that particular book.

**FEATURES:-**In the books page every detailing of an an respective book have Read more buttons to get more info of the particular books. And then also every detail of the books is also a back button to come back and select a specific book.is there a buy now button it does not do anything it adds only for attraction.

**TECHNOLOGIESUSED:-**i have used html for basic structure and css for styling.

**DEMO:-**in these particular books page website the main page consists of one popular book and below have some recommended books .We want to buy it or know about that particular book we click the read more button and finally we have an one back to come to the main page.

**APPROACH:-**books page website is divided into multiple sections

- Firstly I wanted to build the Background section to elevate figures on it.once it's done
- I have to able to go Popular book section and place a background place the relevant image for book and maintain ccbpi-kit for one page to detailed page.after that ,
- I am choosing the Recommended books section for different books with the same above manner.
- Finally done with Recommended books images and then matter on those books.

**CHALLENGES AND SOLUTION:-**in these particular books page project i am facing some struggle to get details of the peculiar book when clicked the read more.but that time i have used ccbp ui-kit to solve that .

**INDUSTRY BEST PRACTICES:-**i have used descriptive variable names,i followed naming conventions appropriately i have used a proper folder structure
