

## FOOD MUNCH

Project intro:-food munch is a responsive website for a restaurant,where you can see a list of food items,offers and other information.

Features:-

- Responsive navbar for mobile and desktop.
- Navigating into specific sections of the page.
- Apart from that i have also implemented header , there have a navbar using this i have to navigate to different sections,and navbar is is responsive so incase of mobile section a hamburger icon is in the top right then click view various section then clicking on it we go to that specific section,but in desktop no need of hamburger icon they visible.

Technologies:-I have used html for basic structure and css for styling bootstrap grid system for achieving responsive layout.also used bootstrap navbar ,model.for testing i have used browser developing tools.

APPROACH:-foodmunch website is divided into multiple sections

- navbar(i have used the bootstrap navbar here once it was responsive then i moved forward to the banner section.
- So i understood the various elements present here so then i have built the layout completely once the entire output is clear .the i moved to why choose us section
- Why choose us? section cleared the testing for proper layout i am going to the explore menu and so on.

There was a gift section so where in case of the desktop we won the gift to be at the right and details in left ,but in mobile approach it is done one by one.at that time used bootstrap order class names to change the order of sections.

INDUSTRY BEST PRACTICES:-i have used descriptive variable names,i followed naming conventions appropriately i have used a proper folder structure.
